WHAT IS CLAIMED IS

1. An optical scanning device directing a light beam emitted from a light source to a mirror of a mechanical deflector through a first optical system, deflecting the light beam in a main scanning direction by causing the light beam to be reflected by a mirror surface of said mirror, the angle of said mirror surface changing due to rotation of said mirror, and directing the deflected light beam through a second optical system to a surface to be scanned moving in a sub-scanning direction, said light source, first optical system, mechanical deflector and second optical system being contained in a housing,

wherein said mechanical deflector is directly mounted to said house, and, also, material of said housing has heat conductivity smaller than that of a part of said mechanical deflector in contact with said housing.

- 2. The optical scanning device as claimed in claim 3, wherein said mechanical deflector is covered by a cover having an optical window, and, thereby, an air flow occurring due to rotation of said mirror is kept within said cover.
- The optical scanning device as claimed in claim
 wherein a cooling part forcibly cooling said
 mechanical deflector is provided.
